

LLM Declaration Statement

Declaration of AI Usage

I, Joseph Kalayathankal Saji, hereby declare that a Large Language Model (Google Gemini) was utilized as an assistive tool during the development, debugging, and drafting phases of this Travel Companion application project. All AI-generated content, including code structure and logic, was critically reviewed, tested, and validated to ensure accuracy, functionality, and alignment with the project requirements.

Specific areas of AI assistance include

- UI/UX Layout Generation - Assisted in generating the foundational XML code for the Android application interface, ensuring proper structuring of the LinearLayout, input fields, and dropdown Spinners.
- Core Logic Implementation - Guided the development of the Java-based conversion algorithms within MainActivity.java. This included structuring a hub-and-spoke method for dynamic currency calculations and implementing comprehensive input validation to prevent runtime crashes.
- Debugging and Troubleshooting - Aided in interpreting Android Studio Logcat errors, specifically identifying and resolving a critical XML InflateException during the build process, as well as providing strategies for device deployment and emulator optimization.
- Research and Exploration - Utilized to synthesize information, explore technical Android development practices (such as implementing ArrayAdapter for dynamic UI updates), and verify standard conversion factors for fuel, distance, and temperature. Used for getting information regarding Google Nano.
