

LLM Declaration Statement

Declaration of AI Usage

I, Joseph Kalayathankal Saji, declare that a Large Language Model (Gemini) was used to assist with Task 4.1p (Personal Event Planner App) for SIT708.

Scope of AI Assistance

The LLM was used strictly as an architectural tutor and structural guide. No raw source code was generated or copied from the AI. The AI was utilized to understand Android documentation, evaluate best practices, and map out the data flow before implementation.

Specific Areas Influenced by AI

- **Architectural Planning:** The decision to structure the application using the MVVM (Model-View-ViewModel) design pattern to cleanly separate UI components from business logic.
- **Data Persistence Strategy (Room):** Conceptual research on how Room manages physical SQLite files and ACID transactions to prevent data corruption during app crashes.
- **Data Type Formatting:** The architectural decision to store dates as **Long** (Unix epoch milliseconds) utilizing Room **TypeConverters** instead of text strings, optimizing for flawless chronological sorting and mathematical validation logic.
- **Navigation Architecture:** Theoretical understanding of the Jetpack Navigation Component, specifically mapping out the Single-Activity Architecture, utilizing the Navigation Graph, and passing data safely between Fragments.
- **UI/UX Standards:** Reviewing official Google documentation on Material Design 3 (M3) to understand dynamic theming, component states, and layout consistency.
